

## how secure are... **YOUR MEMORY STICKS?**

Yesterday, according to BBC News: "A contractor working for the Home Office...lost a computer memory stick containing personal details about tens of thousands of criminals."

How many of *your* employees need to use USB sticks on a daily basis to transfer data between different systems, to work at home etc.?

ISL are delighted to be able to now provide the ultra secure Kanguru USB2 Flash Drives which utilize 256-Bit AES Encryption to protect data stored on the drive. We can also supply their range of Biometric flash drives which store 5-10 fingerprints.

If the drive is lost or stolen, no one can access the data without your password.

Keep your data safe at all times. Now, there's no excuse.
